

Site Management Practices Consumer Fact Sheets

Current at: 12 July 2007

Increasingly during the construction and landscaping of a home consumers are looking for practices in which they can protect our rivers and creeks. To assist HIA have developed two fact sheets.

The First, [A Residents' Guide to Constructing a Home](#) has been developed to provide practical tips for those that have purchased a parcel of land on which they plan to construct or renovate a home.

The Second, [A Residents' Guide to Landscaping a Home](#) provides practical advice to assist consumers future landscaping projects.

As appropriate to the site, consideration of these practices will reduce soil erosion, waste generation and stormwater pollution of our rivers and creeks.

Further detailed information can be found in the *Site Management Guide for Residential Builders*. The Guide is produced on a CD and includes a site management checklist, a site management plan template and photos of a range of measures available in use on residential building sites. If you would like a copy of the Guide or further information, contact HIA Planning and Environment staff on 03 9280 8200 or [click here](#).

HIA would like to acknowledge the generous support of [Melbourne Water](#) in supporting the GreenSmart Professionals: protecting our rivers and creeks program.
